

Observability

Actuator Endpoints

1. Health Check

2. Readiness/Liveness

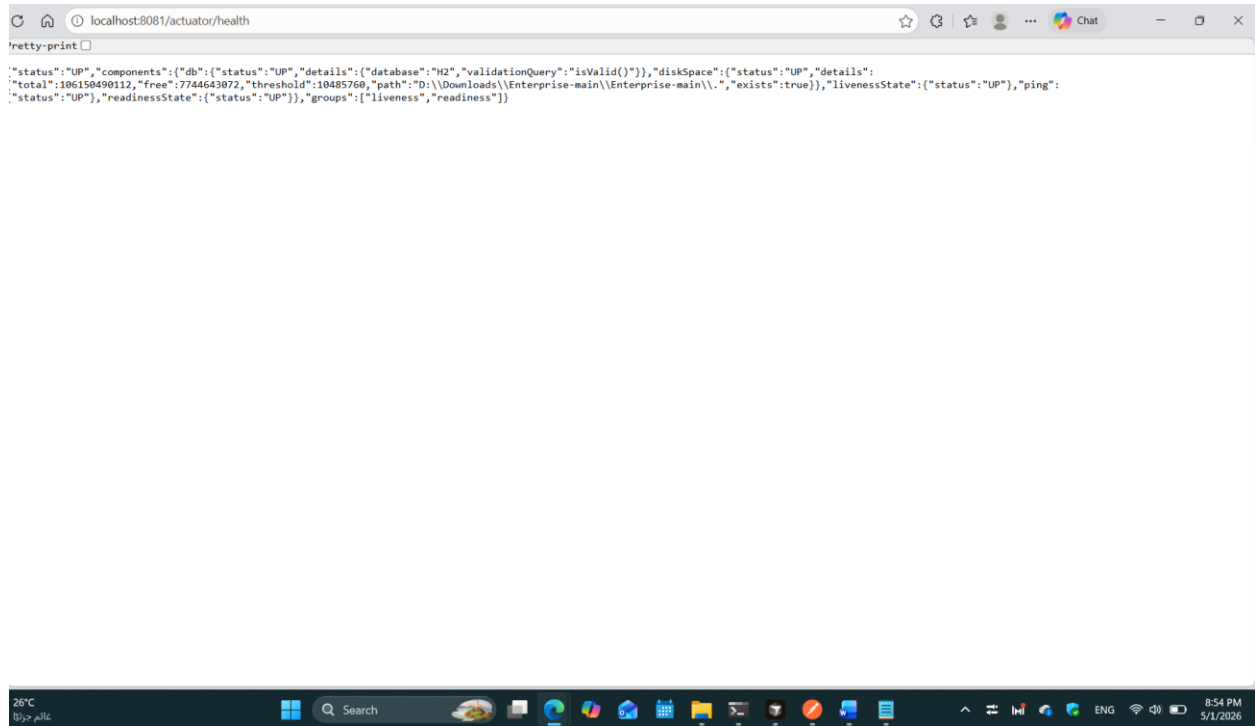

GET /actuator/health

****Expected:****

{

"status": "UP"

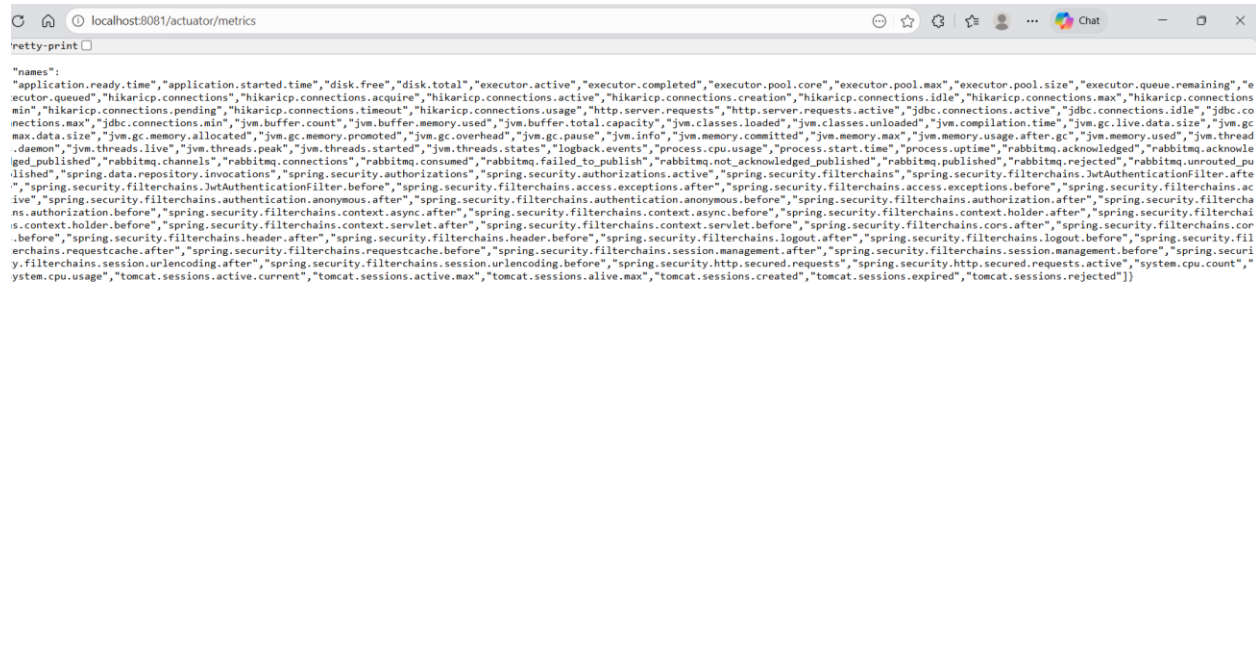

}

3. Metrics

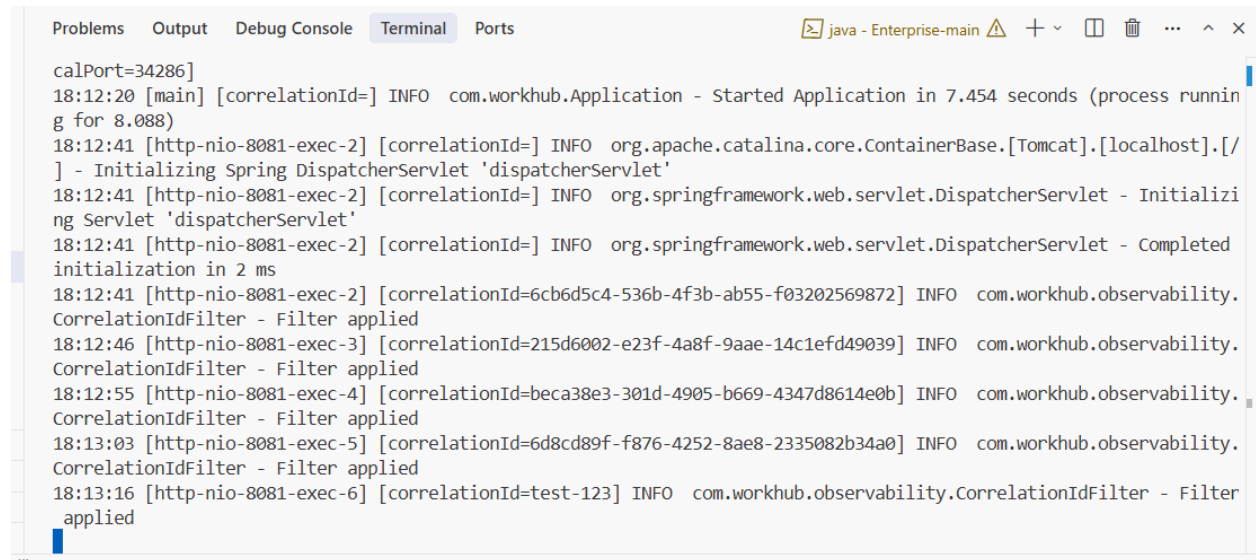

GET /actuator/metrics

****Result:**** Metrics available

Correlation logging with unique request ID

The logs show that every request is tagged with a unique `correlationId`, which helps trace requests across the system for debugging and monitoring purposes.

Security Note

Actuator endpoints are publicly accessible for testing.
In production, they should be secured.

Conclusion

System observability is implemented via:

- * Health checks
- * Metrics
- * Correlation logging successfully implemented and verified in runtime logs
